**ON THE COVER**

Three-dimensional structure of a yeast spliceosome. In eukaryotes, genetic information stored in DNA is transcribed into precursor messenger RNA (pre-mRNA),

which contains protein-coding exons interspersed with noncoding introns. The splicing of pre-mRNA, which entails removal of introns and covalent linkage of exons, is mediated by a multicomponent ribonucleoprotein complex—the spliceosome. See pages 1182 and 1191. *Illustration: C. Bickel/Science; structure based on the cryo-EM map of a yeast spliceosome (EMDB ID EMD-6413)*
